It was there explained that in girders of uniform but unsymmetrical section, even when isotropic by design, the position of the neutral plane might practically vary to some small unknown degree. This uncertainty is still more troublesome in girders of uniform strength where the neutral axis is not horizontal; and the before-mentioned limitation, or allowance for variation of neutral axis, will also be more largely applied when dealing with these. The results will necessarily be merely approximative; the methods of arriving at them will be analogous to those employed in Solutions Nos. 5 and 6 for symmetrical sections of isotropic material. I. With an equally distributed load, adopting the unsymmetrical section used in Solution 4 and the method employed in Solution 5, we have generally, at every section...
